给定一个2 * N的数组,从任意点开始,每次选择一个数,要求所选择的数与上一次选择的数不能相邻(水平、垂直或对角),求所能够选择到的所有数字的最大和

初始在第一列时,维护两个变量:includeColSum——表示选择当前列中的数之后的最大和,excludeColSum——不选择当前列中的 数的最大和,初始化includeColSum = max(arr[0][0], arr[1][0]),excludeColSum = 0;

从第二列开始(索引下标从1开始),maxExcludeCurColSum记录不包含当前列的最大值,然后更新includeColSum与excludeColSum

```
#include <bits/stdc++.h>
using namespace std;
typedef vector<int> vi;
typedef vector<vector<int>> vvi;
int maxSum(vvi &arr, int &N) {
   int includeColSum = max(arr[0][0], arr[1][0]), excludeColSum = 0;
   for (int col = 1; col < N; ++col) {
       int maxExcludeCurColSum = max(includeColSum, excludeColSum);
        includeColSum = excludeColSum + max(arr[0][col], arr[1][col]);
        excludeColSum = maxExcludeCurColSum;
   return max(includeColSum, excludeColSum);
}
int main() {
   int T;
   scanf("%d", &T);
   while (T--) {
       int N;
        scanf("%d", &N);
        vvi arr(2, vi(N));
       for (int i = 0; i < 2; ++i)
            for (int j = 0; j < N; ++j)
                scanf("%d", &arr[i][j]);
       printf("%d\n", maxSum(arr, N));
   }
}
```
