The painter's partition problem

给定一个boards数组,boards[i]表示画板i的长度也代表了填满画板所需要的时间;一共有K名画家,每名画家可以在连续的画板上进行绘制,求在K名画家的情况下,绘制完所有画板所需的最短时间

```
#include <bits/stdc++.h>
using namespace std;
using vi = vector<int>;
// 在每位painter只能绘制maxLen长度的限制下,绘制boards数组所需要的painter数量
int numberOfPainters(vi &boards, int maxLen) {
   int total = 0, numberPainters = 1;
   for (int a: boards) {
       total += a;
       if (total > maxLen) {
           total = a;
           numberPainters++;
       }
    return numberPainters;
}
int minPaintTime(vi &boards, int K) {
   // 此时对应painters = N的情况
   int minLen = *max_element(boards.begin(), boards.end());
   // 此时对应painters = 1的情况
   int maxLen = accumulate(boards.begin(), boards.end(), 0);
   // 在minLen与maxLen之间进行二分搜索painters = K的情况
   int low = minLen, high = maxLen;
   while (low < high) {
       int mid = low + (high - low) / 2;
       // 在每位painter最多绘制mid长度的限制下,绘制boards所需要的最小painter的数量
       int requiredPainters = numberOfPainters(boards, mid);
       if (requiredPainters <= K) high = mid;</pre>
       else
           low = mid + 1;
   }
    return low;
}
int main() {
   int T;
   scanf("%d", &T);
   while (T--) {
       int N, K;
       scanf("%d %d", &N, &K);
       vi boards(N);
       for (int i = 0; i < N; ++i) scanf("%d", &boards[i]);
       printf("%d\n", minPaintTime(boards, K));
   return 0;
}
```
